

## Continuing Probability.

Wrap up: Total Probability and Conditional Probability.

Product Rule, Correlation, Independence, Bayes' Rule,

## Total probability

Assume that  $\Omega$  is the union of the disjoint sets  $A_1, \dots, A_N$ .

Then,

$$Pr[B] = Pr[A_1 \cap B] + \dots + Pr[A_N \cap B].$$

Indeed,  $B$  is the union of the disjoint sets  $A_n \cap B$  for  $n = 1, \dots, N$ .

## Conditional probability: example.

Two coin flips. First flip is heads. Probability of two heads?

$\Omega = \{HH, HT, TH, TT\}$ ; Uniform probability space.

Event  $A =$  first flip is heads:  $A = \{HH, HT\}$ .

$\Omega$  : uniform

New sample space:  $A$ ; uniform still.

Event  $B =$  two heads.

The probability of two heads if the first flip is heads.

**The probability of  $B$  given  $A$  is  $1/2$ .**

## Conditional Probability.

**Definition:** The **conditional probability** of  $B$  given  $A$  is

$$Pr[B|A] = \frac{Pr[A \cap B]}{Pr[A]}$$

## Emptiness..

Suppose I toss 3 balls into 3 bins.

$A$  = "1st bin empty";  $B$  = "2nd bin empty." What is  $Pr[A|B]$ ?

$$Pr[B] = Pr[\{(a, b, c) \mid a, b, c \in \{1, 3\}\}] = Pr[\{1, 3\}^3] = \frac{8}{27}$$

$$Pr[A \cap B] = Pr[(3, 3, 3)] = \frac{1}{27}$$

$$Pr[A|B] = \frac{Pr[A \cap B]}{Pr[B]} = \frac{(1/27)}{(8/27)} = 1/8; \text{ vs. } Pr[A] = \frac{8}{27}.$$

$A$  is less likely given  $B$ : If second bin is empty the first is more likely to have balls in it.

# Three Card Problem

Three cards: Red/Red, Red/Black, Black/Black.

Pick one at random and place on the table. The upturned side is a

Red. What is the probability that the other side is Black?

Can't be the BB card, so...prob should be 0.5, right?

$R$ : upturned card is Red;  $RB$ : the Red/Black card was selected.

Want  $P(RB|R)$ .

What's wrong with the reasoning that leads to  $\frac{1}{2}$ ?

$$\begin{aligned}
 P(RB|R) &= \frac{P(RB \cap R)}{P(R)} \\
 &= \frac{\frac{1}{3} \frac{1}{2}}{\frac{1}{3}(1) + \frac{1}{3} \frac{1}{2} + \frac{1}{3}(0)} \\
 &= \frac{\frac{1}{6}}{\frac{1}{2}} = \frac{1}{3}
 \end{aligned}$$

Once you are given  $R$ : it is twice as likely that the RR card was picked.

## Gambler's fallacy.

Flip a fair coin 51 times.

$A$  = “first 50 flips are heads”

$B$  = “the 51st is heads”

$Pr[B|A]$  ?

$A = \{HH \dots HT, HH \dots HH\}$

$B \cap A = \{HH \dots HH\}$

Uniform probability space.

$$Pr[B|A] = \frac{|B \cap A|}{|A|} = \frac{1}{2}.$$

Same as  $Pr[B]$ .

The likelihood of 51st heads does not depend on the previous flips.

## Product Rule

Recall the definition:

$$Pr[B|A] = \frac{Pr[A \cap B]}{Pr[A]}.$$

Hence,

$$Pr[A \cap B] = Pr[A]Pr[B|A].$$

Consequently,

$$\begin{aligned} Pr[A \cap B \cap C] &= Pr[(A \cap B) \cap C] \\ &= Pr[A \cap B]Pr[C|A \cap B] \\ &= Pr[A]Pr[B|A]Pr[C|A \cap B]. \end{aligned}$$

# Product Rule

## Theorem Product Rule

Let  $A_1, A_2, \dots, A_n$  be events. Then

$$Pr[A_1 \cap \dots \cap A_n] = Pr[A_1]Pr[A_2|A_1] \cdots Pr[A_n|A_1 \cap \dots \cap A_{n-1}].$$

**Proof:** By induction.

Assume the result is true for  $n$ . (It holds for  $n = 2$ .) Then,

$$\begin{aligned} Pr[A_1 \cap \dots \cap A_n \cap A_{n+1}] &= Pr[A_1 \cap \dots \cap A_n]Pr[A_{n+1}|A_1 \cap \dots \cap A_n] \\ &= Pr[A_1]Pr[A_2|A_1] \cdots Pr[A_n|A_1 \cap \dots \cap A_{n-1}]Pr[A_{n+1}|A_1 \cap \dots \cap A_n], \end{aligned}$$

so that the result holds for  $n + 1$ . □

# Correlation

An example.

Random experiment: Pick a person at random.

Event  $A$ : the person has lung cancer.

Event  $B$ : the person is a heavy smoker.

Fact:

$$Pr[A|B] = 1.17 \times Pr[A].$$

Conclusion:

- ▶ Smoking increases the probability of lung cancer by 17%.
- ▶ Smoking causes lung cancer.

## Correlation

Event  $A$ : the person has lung cancer. Event  $B$ : the person is a heavy smoker.  $Pr[A|B] = 1.17 \times Pr[A]$ .

A second look.

Note that

$$\begin{aligned} Pr[A|B] = 1.17 \times Pr[A] &\Leftrightarrow \frac{Pr[A \cap B]}{Pr[B]} = 1.17 \times Pr[A] \\ &\Leftrightarrow Pr[A \cap B] = 1.17 \times Pr[A]Pr[B] \\ &\Leftrightarrow Pr[B|A] = 1.17 \times Pr[B]. \end{aligned}$$

Conclusion:

- ▶ Lung cancer increases the probability of smoking by 17%.
- ▶ Lung cancer causes smoking. Really?

## Causality vs. Correlation

Events  $A$  and  $B$  are **positively correlated** if

$$Pr[A \cap B] > Pr[A]Pr[B].$$

(E.g., smoking and lung cancer.)

$A$  and  $B$  being positively correlated does not mean that  $A$  causes  $B$  or that  $B$  causes  $A$ .

Other examples:

- ▶ Tesla owners are more likely to be rich. That does not mean that poor people should buy a Tesla to get rich.
- ▶ People who go to the opera are more likely to have a good career. That does not mean that going to the opera will improve your career.
- ▶ Rabbits eat more carrots and do not wear glasses. Are carrots good for eyesight?

## Total probability

Assume that  $\Omega$  is the union of the disjoint sets  $A_1, \dots, A_N$ .

Then,

$$Pr[B] = Pr[A_1 \cap B] + \dots + Pr[A_N \cap B].$$

Indeed,  $B$  is the union of the disjoint sets  $A_n \cap B$  for  $n = 1, \dots, N$ .

Thus,

$$Pr[B] = Pr[A_1]Pr[B|A_1] + \dots + Pr[A_N]Pr[B|A_N].$$

# Total probability

Assume that  $\Omega$  is the union of the disjoint sets  $A_1, \dots, A_N$ .

$$Pr[B] = Pr[A_1]Pr[B|A_1] + \dots + Pr[A_N]Pr[B|A_N].$$

## Is your coin loaded?

Your coin is fair w.p.  $1/2$  or such that  $Pr[H] = 0.6$ , otherwise.

You flip your coin and it yields heads.

What is the probability that it is fair?

### Analysis:

$A =$  'coin is fair',  $B =$  'outcome is heads'

We want to calculate  $P[A|B]$ .

We know  $P[B|A] = 1/2$ ,  $P[B|\bar{A}] = 0.6$ ,  $Pr[A] = 1/2 = Pr[\bar{A}]$

Now,

$$\begin{aligned} Pr[B] &= Pr[A \cap B] + Pr[\bar{A} \cap B] = Pr[A]Pr[B|A] + Pr[\bar{A}]Pr[B|\bar{A}] \\ &= (1/2)(1/2) + (1/2)0.6 = 0.55. \end{aligned}$$

Thus,

$$Pr[A|B] = \frac{Pr[A]Pr[B|A]}{Pr[B]} = \frac{(1/2)(1/2)}{(1/2)(1/2) + (1/2)0.6} \approx 0.45.$$

## Is your coin loaded?

A picture:

Imagine 100 situations, among which

$m := 100(1/2)(1/2)$  are such that  $A$  and  $B$  occur and

$n := 100(1/2)(0.6)$  are such that  $\bar{A}$  and  $B$  occur.

Thus, among the  $m + n$  situations where  $B$  occurred, there are  $m$  where  $A$  occurred.

Hence,

$$Pr[A|B] = \frac{m}{m+n} = \frac{(1/2)(1/2)}{(1/2)(1/2) + (1/2)0.6}.$$

# Independence

**Definition:** Two events  $A$  and  $B$  are **independent** if

$$Pr[A \cap B] = Pr[A]Pr[B].$$

Examples:

- ▶ When rolling two dice,  $A =$  sum is 7 and  $B =$  red die is 1 are independent;
- ▶ When rolling two dice,  $A =$  sum is 3 and  $B =$  red die is 1 are **not** independent;
- ▶ When flipping coins,  $A =$  coin 1 yields heads and  $B =$  coin 2 yields tails are independent;
- ▶ When throwing 3 balls into 3 bins,  $A =$  bin 1 is empty and  $B =$  bin 2 is empty are **not** independent;

## Independence and conditional probability

**Fact:** Two events  $A$  and  $B$  are **independent** if and only if

$$Pr[A|B] = Pr[A].$$

Indeed:  $Pr[A|B] = \frac{Pr[A \cap B]}{Pr[B]}$ , so that

$$Pr[A|B] = Pr[A] \Leftrightarrow \frac{Pr[A \cap B]}{Pr[B]} = Pr[A] \Leftrightarrow Pr[A \cap B] = Pr[A]Pr[B].$$

## Bayes Rule

Another picture: We imagine that there are  $N$  possible causes  $A_1, \dots, A_N$ .

Imagine 100 situations, among which  $100p_nq_n$  are such that  $A_n$  and  $B$  occur, for  $n = 1, \dots, N$ .

Thus, among the  $100\sum_m p_m q_m$  situations where  $B$  occurred, there are  $100p_nq_n$  where  $A_n$  occurred.

Hence,

$$Pr[A_n|B] = \frac{p_n q_n}{\sum_m p_m q_m}.$$

# Why do you have a fever?

Using Bayes' rule, we find

$$Pr[\text{Flu}|\text{High Fever}] = \frac{0.15 \times 0.80}{0.15 \times 0.80 + 10^{-8} \times 1 + 0.85 \times 0.1} \approx 0.58$$

$$Pr[\text{Ebola}|\text{High Fever}] = \frac{10^{-8} \times 1}{0.15 \times 0.80 + 10^{-8} \times 1 + 0.85 \times 0.1} \approx 5 \times 10^{-8}$$

$$Pr[\text{Other}|\text{High Fever}] = \frac{0.85 \times 0.1}{0.15 \times 0.80 + 10^{-8} \times 1 + 0.85 \times 0.1} \approx 0.42$$

These are the **posterior probabilities**. One says that 'Flu' is the **Most Likely a Posteriori** (MAP) cause of the high fever.

# Bayes' Rule Operations

Bayes' Rule is the canonical example of how information changes our opinions.

# Thomas Bayes

**Thomas Bayes**

Portrait used of Bayes in a 1936 book,<sup>[1]</sup> but it is doubtful whether the portrait is actually of him.<sup>[2]</sup>

No earlier portrait or claimed portrait survives.

<b>Born</b>	c. 1701 London, England
<b>Died</b>	7 April 1761 (aged 59) <a href="#">Tunbridge Wells, Kent, England</a>
<b>Residence</b>	Tunbridge Wells, Kent, England
<b>Nationality</b>	English
<b>Known for</b>	<a href="#">Bayes' theorem</a>

A Bayesian picture of Thomas Bayes.

## Testing for disease.

Let's watch TV!!

Random Experiment: Pick a random male.

Outcomes: (*test, disease*)

*A* - prostate cancer.

*B* - positive PSA test.

- ▶  $Pr[A] = 0.0016$ , (.16 % of the male population is affected.)
- ▶  $Pr[B|A] = 0.80$  (80% chance of positive test with disease.)
- ▶  $Pr[B|\bar{A}] = 0.10$  (10% chance of positive test without disease.)

From [http://www.cpcn.org/01\\_psa\\_tests.htm](http://www.cpcn.org/01_psa_tests.htm) and <http://seer.cancer.gov/statfacts/html/prost.html> (10/12/2011.)

Positive PSA test (*B*). Do I have disease?

$$Pr[A|B]???$$

## Bayes Rule.

Using Bayes' rule, we find

$$P[A|B] = \frac{0.0016 \times 0.80}{0.0016 \times 0.80 + 0.9984 \times 0.10} = .013.$$

A 1.3% chance of prostate cancer with a positive PSA test.

Surgery anyone?

Impotence...

Incontinence..

Death.

# Summary

## Events, Conditional Probability, Independence, Bayes' Rule

Key Ideas:

- ▶ Conditional Probability:

$$Pr[A|B] = \frac{Pr[A \cap B]}{Pr[B]}$$

- ▶ Independence:  $Pr[A \cap B] = Pr[A]Pr[B]$ .
- ▶ Bayes' Rule:

$$Pr[A_n|B] = \frac{Pr[A_n]Pr[B|A_n]}{\sum_m Pr[A_m]Pr[B|A_m]}.$$

$Pr[A_n|B]$  = posterior probability;  $Pr[A_n]$  = prior probability .

- ▶ All these are possible:

$$Pr[A|B] < Pr[A]; Pr[A|B] > Pr[A]; Pr[A|B] = Pr[A].$$
